

ABSTRACT OF THE DISCLOSURE

The present invention relates to a system including a mobile switching centre, a base station communicating with the mobile switching centre, a mobile station including a radio transmitter and a radio receiver for setting up a connection to the base station via the base station, an object including an identification mechanism, and a data processing device in which data relating to said object is maintained. For identifying the object, the mobile station reads the object's identification data from the identification mechanism, and mechanism for transmitting the read identification data by the mobile station's radio transmitter over the radio path via the base station further to the data processing device.
